A New Equal Power Quadrature Branch Line Coupler for Dual-Band Applications

Aijaz M. Zaidi¹, Syed A. Imam¹, Binod K. Kanaujia², *, and Karumudi Rambabu³

Abstract—We present a new equal power quadrature branch line coupler (BLC) for dual-band applications in this paper. A new topology of the dual-band quarter wavelength transmission lines (TL) with the derivation of design equations is also introduced. The proposed BLC is designed using Advanced Design System (ADS) and fabricated on Rogers 5870 at 0.9 GHz and 2.4 GHz center frequencies. The design approach for the proposed dual-band BLC is endorsed by the simulated and measured results. A comparative analysis of this BLC with the previous BLCs is also carried out.

1. INTRODUCTION

Multiband radio frequency circuits are essential components to design compact and low cost multiband wireless communication systems. Branch line couplers and power dividers are a few of the main components used to design a wireless transceiver. For example, the BLC plays a vital role in designing beamforming network/antenna array/Butler Matrix [1–10]. Many structures and design methods were proposed to make these components dual/multiband such as T-shaped TL [11], PI-shaped TL [12–14], PI-shaped TL structure with resonator [15], two-section TL [16], extended port [17], metamaterial [18, 19], composite right left-handed material [20], PI-shaped TL with impedance buffering technique [21] and coupled lines [22–24]. While the conventional BLCs are based on conventional TLs, coupled lines, and metamaterials. The proposed BLC is based on coupled lines and traditional TLs. The coupled lines based BLCs [22, 24] provide a very good amplitude imbalance and phase imbalance respectively, while traditional TLs based BLC [17] provide very good isolation and return loss. The proposed BLC has benefits of the both.

A new equal power quadrature BLC for dual-band applications with a new design methodology is proposed in this paper. A topology for dual-band quarter wavelength (λ/4) TL is also proposed. The topology is a combination of the coupled line and TL, connected in parallel form. It exhibits quarter wavelength TL characteristics at two frequency bands. Mathematical analysis for the dual-band operation of this topology has also been included in this paper. The proposed dual-band equal power quadrature BLC is obtained by replacing each quarter wavelength TL (where Zc and Zc/√2 are the characteristics impedances of TLs) of the single band equal power quadrature BLC (Fig. 1(a)) by the proposed topology of dual-band quarter wavelength TL Fig. 1(b). In Fig. 1(b) Zc1, Zc2 are characteristic even mode impedances; Zodd1, Zodd2 are characteristic odd mode impedances; θ is the electrical length of the coupled lines while Zo1, Zo2, and 2θ are the characteristic impedances and the electrical length of the TLs connected to the corresponding coupled line. To verify the proposed design methodology, a BLC has been designed using Agilent’s Technologies ADS and implemented on 0.787 mm thick Rogers 5870 at 0.9 GHz and 2.4 GHz frequencies.
2. TOPOLOGY OF DUAL-BAND λ/4 TRANSMISSION LINE

The conventional quarter wavelength TL of characteristic impedance $Z_C$ and the proposed topology of dual-band quarter wavelength ($\lambda/4$) TL are shown in Fig. 2. The topology is a combination of the coupled line and conventional TL, connected in parallel form, where $Z_e$, $Z_{odd}$ and $\theta$ are the characteristic even-odd mode impedances and the electrical length of the coupled line respectively, while $Z_o$ is the characteristic impedance, and $2\theta$ is the electrical length of the TL connected to the coupled line. An additional advantage of connecting the TL to the coupled line is that it provides the control on the parameters of the coupled line. Mathematical analysis is explained in the following subsections 2.1–2.3.

2.1. Even Mode Analysis

The equivalent even mode half circuit of the conventional quarter wavelength TL is an open stub of electrical length $45^\circ$, and even mode half circuit of the proposed structure is a combination of two open stubs of impedance $Z_e$ and $Z_o$ with electrical length $\theta$ connected in parallel form, shown in Fig. 3. Equation (1) is obtained by taking both the even mode half circuits equivalent.

$$Y_e = Y_c \cot \theta - Y_o$$

where $Y_o = 1/Z_o$, $Y_e = 1/Z_e$ and $Y_c = 1/Z_c$.

2.2. Odd Mode Analysis

As shown in Fig. 4, the equivalent odd mode half circuit of the conventional quarter wavelength TL is a short stub of electrical length $45^\circ$ while the proposed structure is a parallel combination of two short
stubs of impedance $Z_{\text{odd}}$ and $Z_o$ with electrical length $\theta$. Similarly, Eq. (2) is obtained for the odd mode half circuits.

$$Y_{\text{odd}} = Y_c \tan \theta - Y_0$$  \hspace{1cm} (2)

where $Y_o = 1/Z_o$, $Y_{\text{odd}} = 1/Z_{\text{odd}}$ and $Y_c = 1/Z_c$.

### 2.3. Dual Band Operation

The BLC’s (shown in Fig. 1(a)) $S$-parameters characteristics remain the same for both $+90^\circ$ TL and $-90^\circ$ TL. Here both the cases are considered for dual-band operation. The proposed dual-band quarter wavelength TL is equivalent to the $+90^\circ$ and $-90^\circ$ conventional TLs at $f_1$ and $f_2$, respectively. Eqs. (1) and (2) can be rewritten as

$$Y_e = +Y_c Cot\theta_1 - Y_0$$
$$Y_e = -Y_c Cot\theta_2 - Y_0$$  \hspace{1cm} (3)

$$Y_{\text{odd}} = +Y_c \tan \theta_1 - Y_0$$
$$Y_{\text{odd}} = -Y_c \tan \theta_2 - Y_0$$  \hspace{1cm} (4)

where $\theta_1$ and $\theta_2$ are the electrical lengths of the coupled lines at the operating frequencies $f_1$ and $f_2$, respectively. Eqs. (3) and (4) will be valid at two frequencies $f_1$ and $f_2$ when

$$\theta_1 + \theta_2 = m\pi$$  \hspace{1cm} (5)

where $m = 1, 2, 3 \ldots$.

The values of $\theta_1$ and $\theta_2$ are obtained from Eq. (5). Here, $m = 1$ is taken for the compact size.

$$\theta_1 = \frac{\pi}{1 + K}$$  \hspace{1cm} (6)

$$\theta_2 = \frac{K\pi}{1 + K}$$  \hspace{1cm} (7)

where $K$ is the ratio of frequencies $f_2$ and $f_1$.

### 3. DESIGN AND IMPLEMENTATION

For simplicity and fabrication easiness, $Z_c = 50\, \Omega$ and $Z_{o1} = 70.7\, \Omega$, $Z_{o2} = 100\, \Omega$ have been selected for the BLCs shown in Fig. 1(a) and Fig. 1(b), respectively. The values of all the components of the proposed BLC (Fig. 1(b)) have been calculated using Eqs. (1), (2), and (6). The calculated values of all the components with their optimized dimensions are given in Table 1. The proposed BLC has been fabricated on 0.787 mm thick Rogers 5870 with dielectric constant $\varepsilon_r = 2.33$ and Tan$\delta = 0.0012$, shown in Fig. 5. To reduce the size of the BLC, all the four TLs which are connected parallel to the coupled lines make an outer round to the corresponding coupled line. The size of the implemented circuit is $6.4\, \text{cm} \times 8.3\, \text{cm}$.

4. SIMULATION AND MEASUREMENT RESULTS

The simulated and measured results of the proposed BLC are shown in Figs. 6–11. A good agreement between simulated and measured results is found. The results are summarized in Table-2. Port 1 and port 2, port 3 are considered as the input and output ports, respectively. The simulated and measured results verify that the equal power division \(|S_{21}| = |S_{31}|\) and quadrature phase difference \((\angle S_{21} - \angle S_{31} = \pm 90^\circ/270^\circ)\) at port 2 and port 3 have been achieved for both the frequency bands with 0.22 dB maximum amplitude imbalance \((\Delta A = |S_{21}| - |S_{31}|)\) and 0.6° maximum phase deviation \((\angle S_{21} - \angle S_{31} = \pm 90^\circ/270^\circ \pm \Delta \phi, \text{where } \Delta \phi \text{ is the phase deviation})\) while maintaining the \(\leq -26.63 \text{ dB}\)

return loss ($|S_{11}|$) and $\leq -23.30$ dB isolation loss ($|S_{41}|$) at the center frequencies of both the frequency bands. The amplitude imbalance is within $\pm 0.5$ dB and is maintained from 0.82 GHz to 0.98 GHz for 0.9 GHz frequency band and 2.33 GHz to 2.60 GHz for 2.4 GHz frequency band, respectively, shown in Fig. 10. The phase deviation within $\pm 5^\circ$ is preserved from 0.79 GHz to 1.01 GHz for 0.9 GHz
A comparative analysis of this work with existing dual-band BLCs is presented in Table 3. This BLC has better amplitude imbalance and phase imbalance than most of the previously designed BLCs at high band ratio with an expense of bandwidth (BW) percentage for return loss and isolation loss for upper band. All these results verify that the proposed design methodology is accurate for designing a dual-band BLC.

frequency band and 2.37 GHz to 2.49 GHz for 2.4 GHz frequency band, respectively, shown in Fig. 11. A comparative analysis of this work with existing dual-band BLCs is presented Table 3. This BLC has better amplitude imbalance and phase imbalance than most of the previously designed BLCs at high band ratio with an expense of bandwidth (BW) percentage for return loss and isolation loss for upper band. All these results verify that the proposed design methodology is accurate for designing a dual-band BLC.

### 5. CONCLUSION

A new equal power, quadrature BLC for dual-band applications with a new design approach has been presented, designed, implemented and verified. A new topology of the dual-band quarter wavelength TL, with complete design equations, has also been introduced here. The performance of the proposed BLC has been demonstrated including return loss, isolation loss, insertion loss, magnitude and quadrature phase condition. The comparative analysis has proved that the presented BLC design has a better magnitude and phase imbalance than the previous BLCs.
